

Energy Best Practices and Processing Residue Assessment for California Food Processors

Tuesday, February 1, 2012

12:00pm – 1:00pm

Sacramento Convention Center

Speaker: Ricardo Amon, CIFAR, UC Davis

A new ISO 50001 energy efficiency management certification program is being implemented and the value to food processors is being studied. A California Energy Commission study has been completed on assessing the energy potential from conventional and organic food processing residues. This includes not only residual byproducts, but low and high moisture materials (process/rinse water) as well. This will highlight a whole systems approach to this issue of process energy, water resources and residue management.
